Context :

## Biofouling effect on marine sensors : Progressive interface modification.

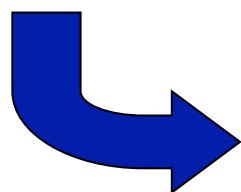

- Optical sensors : turbidimeter, fluorometer, ...

=> optical property modification  
(Window opacity, interference, ...)

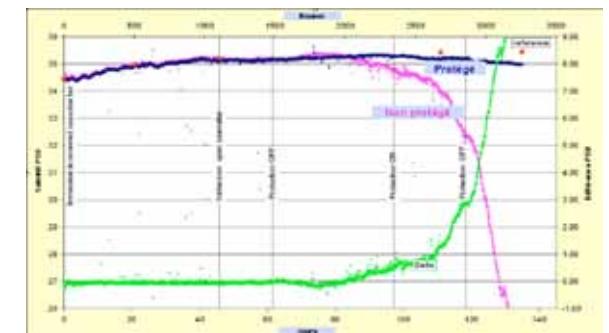

- Membrane based sensors : pH, oxygen.

=> membrane permeability modifications.

Loss of sensibility,  
drift,  
response time, etc.

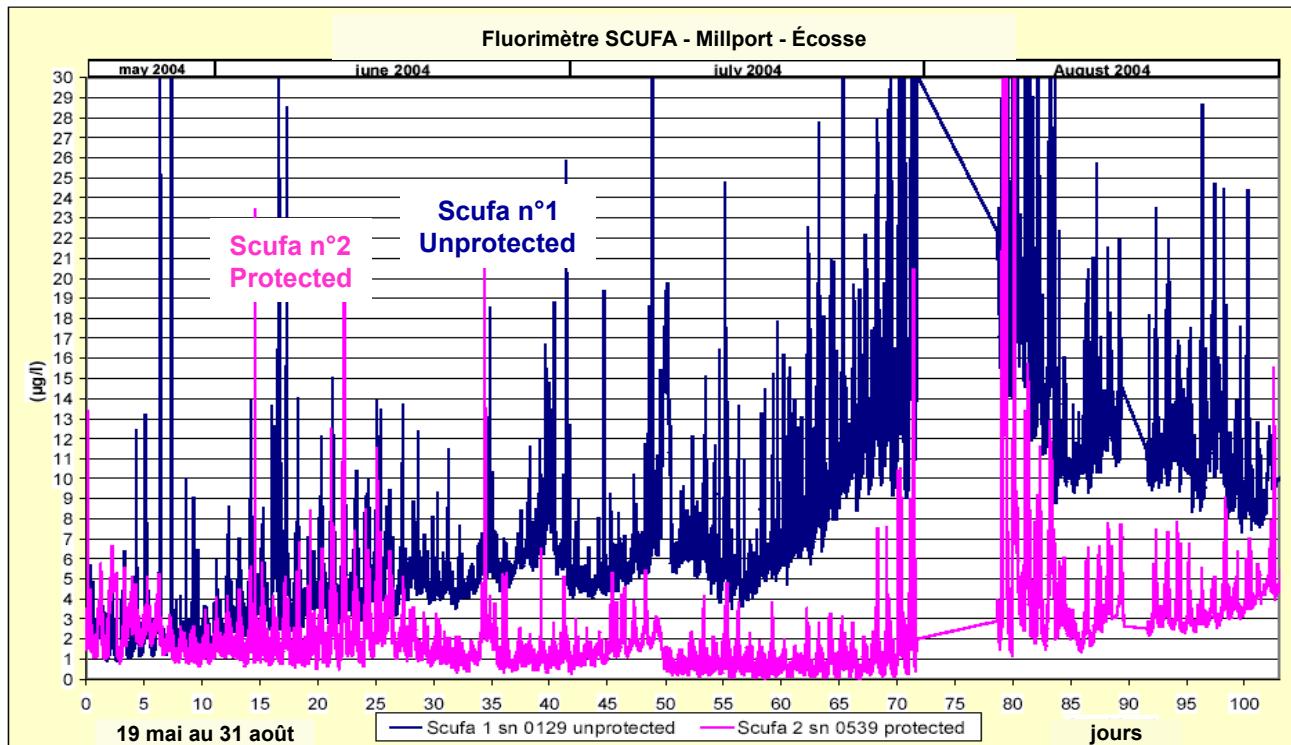

This problem must be treated as long as autonomous measurement longer than 1 week is involved.

Conductivity Measurement - TPS35 Micrel Instrument

PucesCom  
■ ■ ■

Context :

## Objectives

➤ The protection system must delay the biofouling effect on the response of the measuring system for at least 1 month in severe conditions and for 3 months in average condition.

For specific applications like deep sea observatories, biofouling protection effect should last for at least 6 months.

➤ The protection system should be compatible with autonomous energy supplying (batteries).

➤ The protection system must be adaptable quite easily on existing instrumentation.

➤ The protection system must not affect the measurements produced.

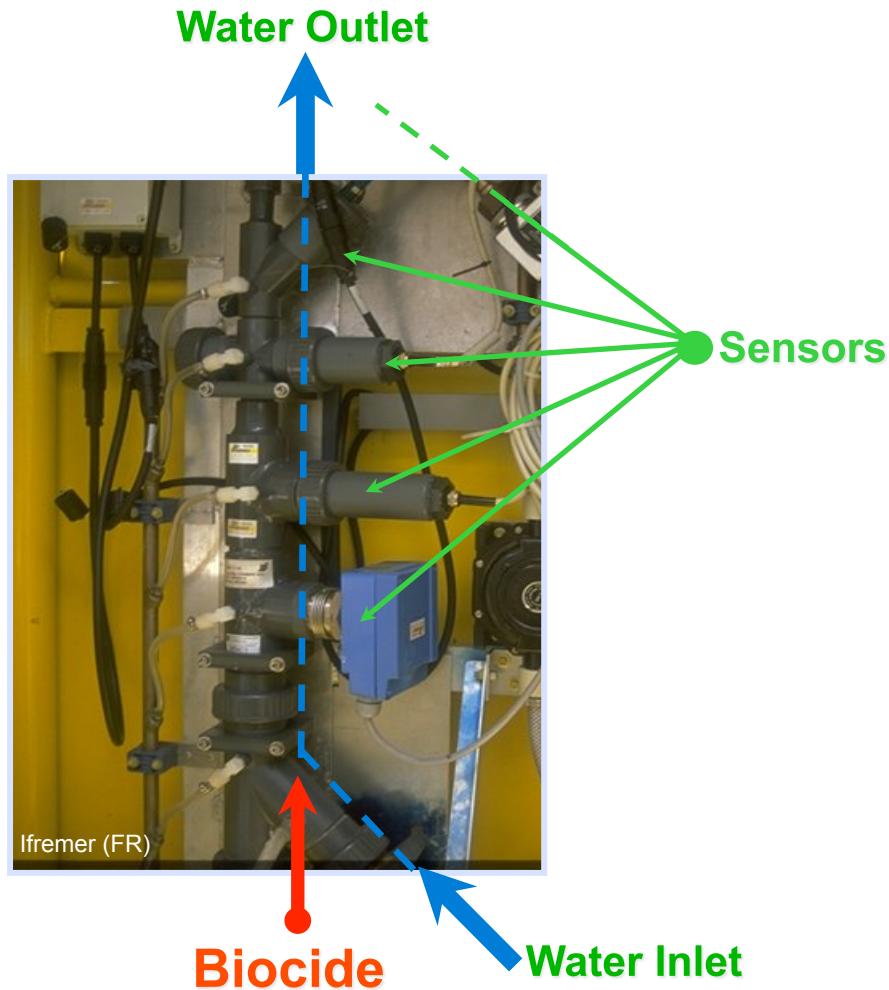

## **Protection strategies:**

**To get closer and closer to the  
measurement interface ...**

Strategies :

# Global Protection

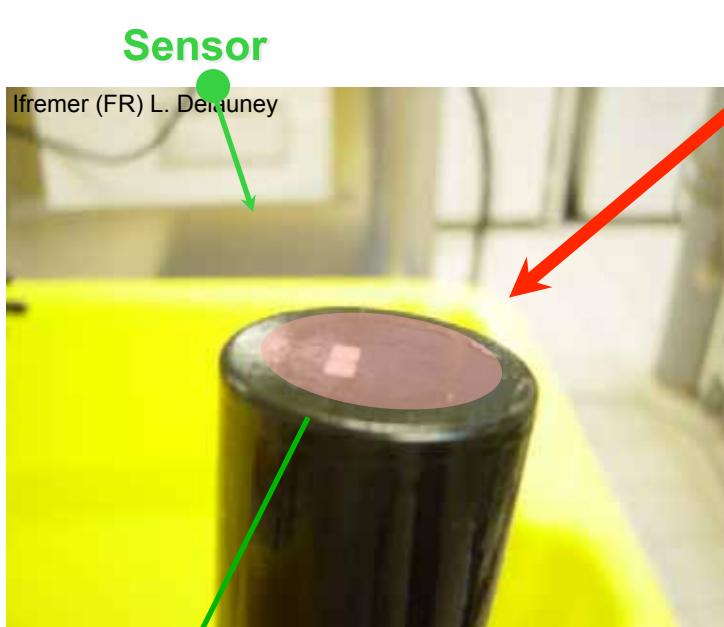

- Pumping is needed

MAREL - Ifremer  
Mesures Automatisées pour l'environnement littoral  
(Autonomous Measurement for Coastal Environment)

Strategies :

## Local Protection

Biocide

- Pumping system not needed
- Biocide can be localised as close as possible of the sensing element of the instrument.

Strategies :

## Coated window Protection

### Interface Modification

Glass window coated with a specific material  
in order to generate biocide on the surface  
(Work in progress)

TriOS microFlu-chl

- Optical sensor, camera, lights, ...
- biocide generation is situated on the window surface.
- Biocide quantity needed is very low.

# **Existing biofouling protection for oceanographic sensors**

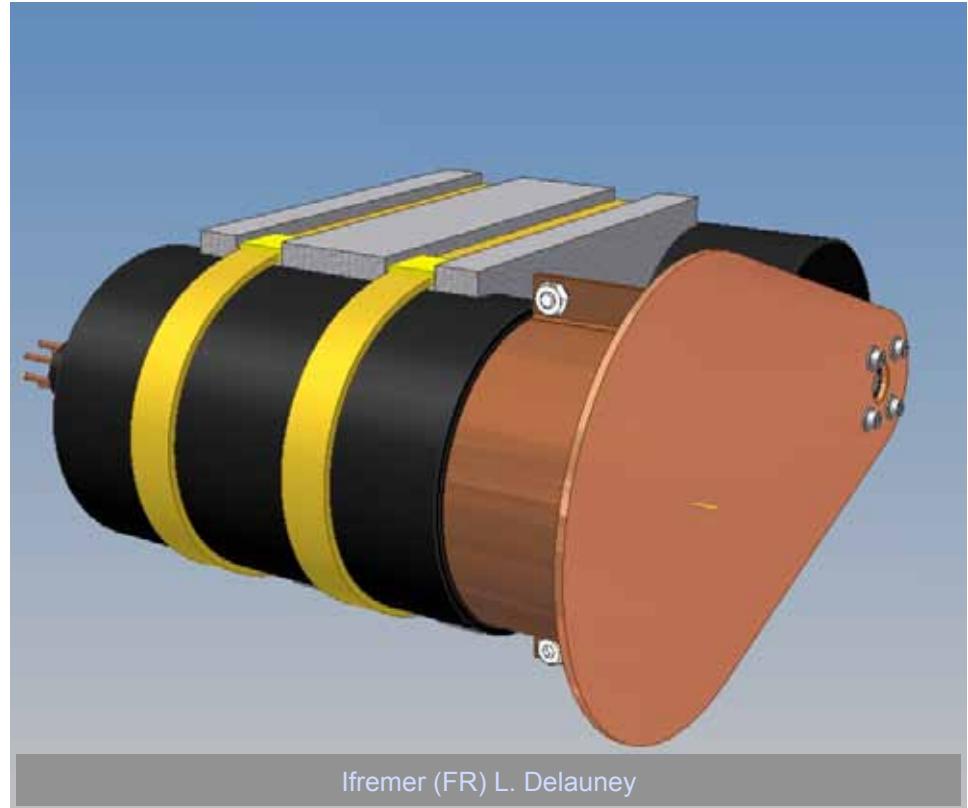

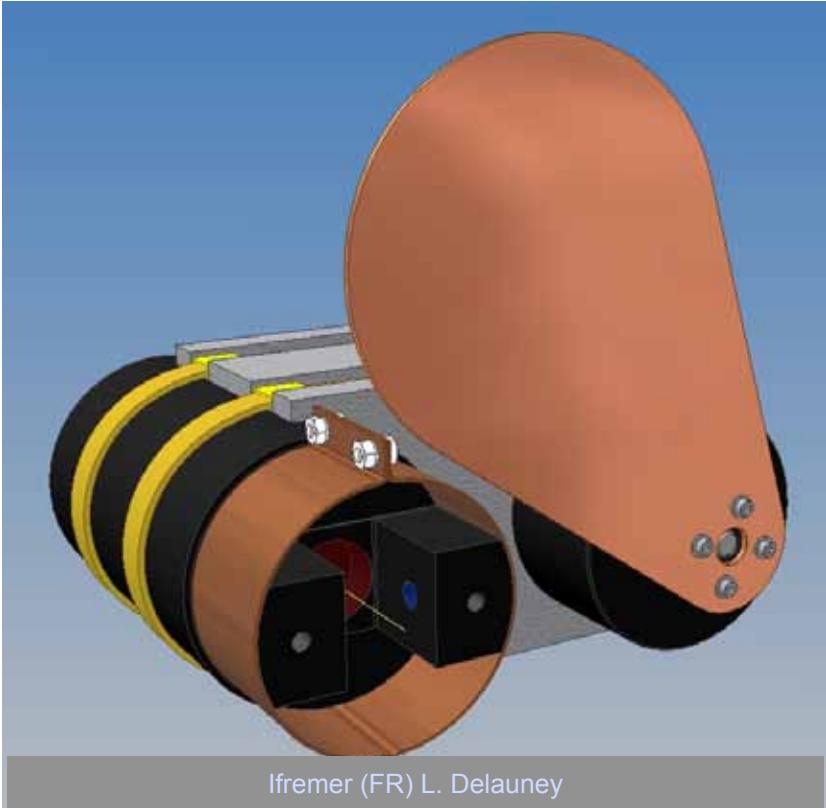

# Mecanical Protection

YSI 6600 EDS (Extended Deployment System) - Clean Sweep™

# Copper Biofouling protection

Fluorimeter Seapoint + Hobilabs Hydroshutter

- The instrument must be customised in order to build a Copper cell.
- The Hydroshutter must be controlled by an external unit in order to open and to close it.

Ifremer (FR) L. Delauney

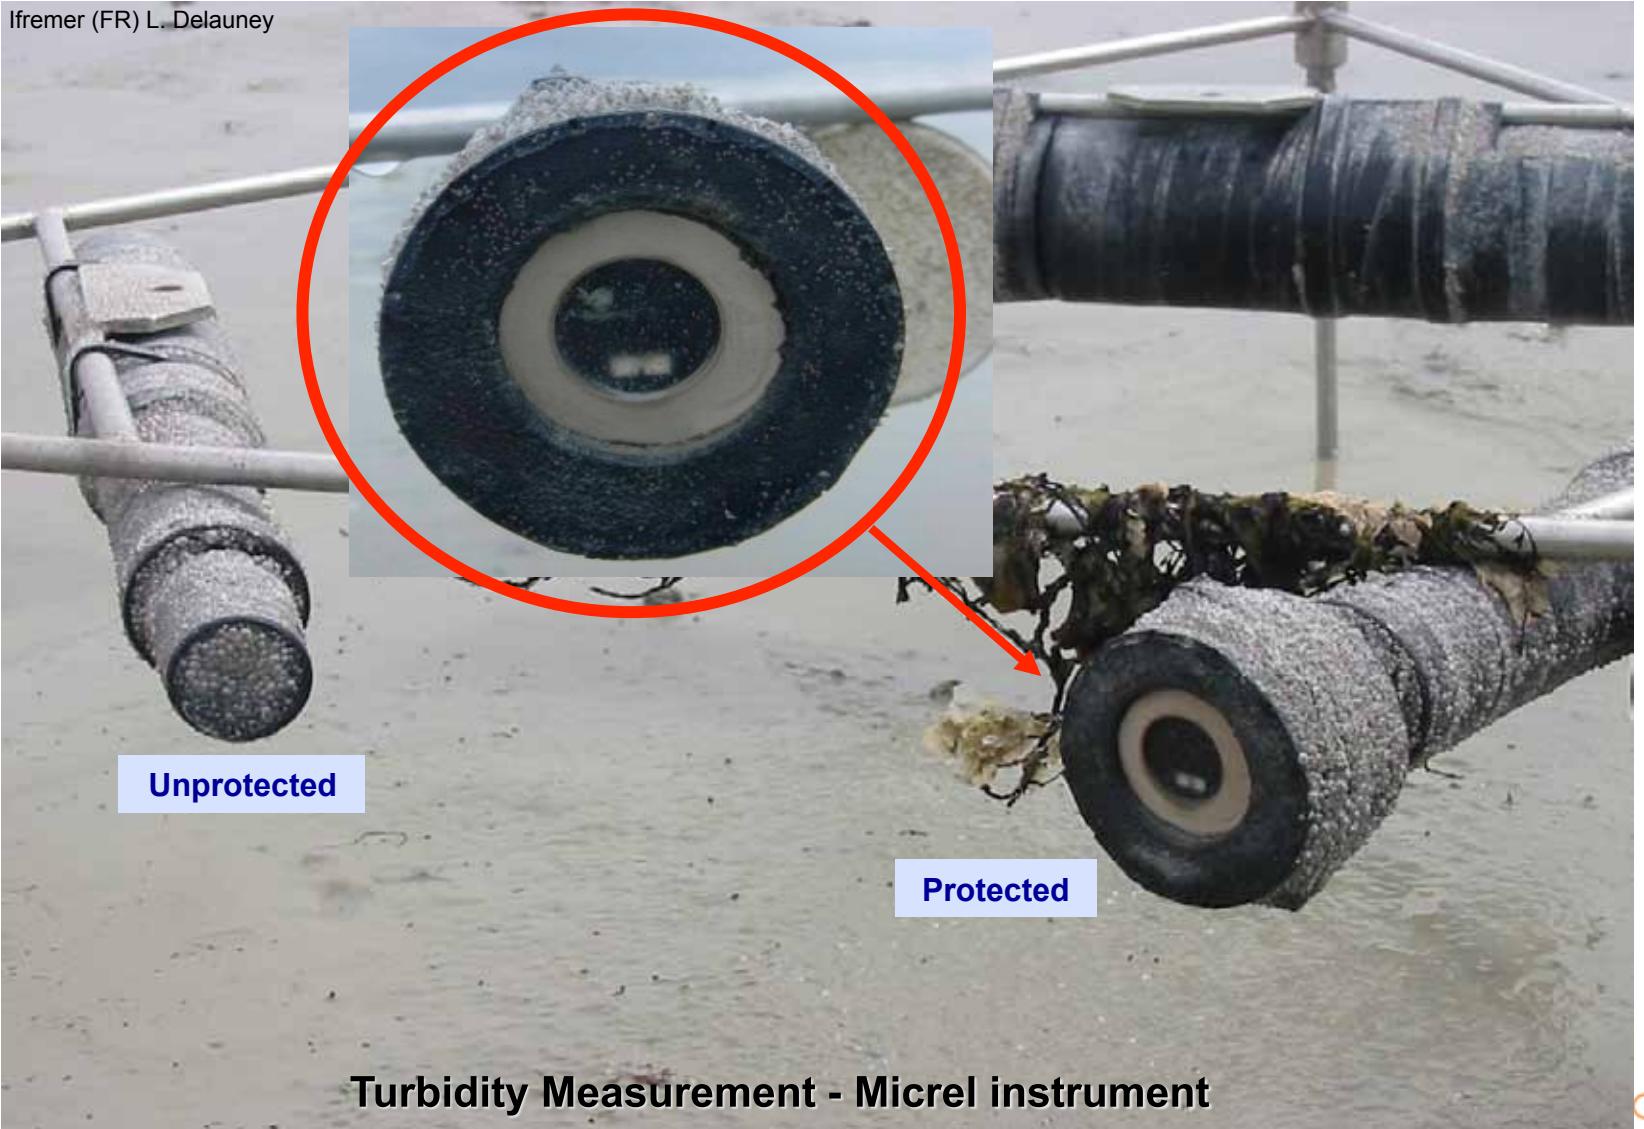

# Copper Biofouling protection

Ifremer (FR) L. Delauney Y. Faijan  
GKSS (DE) K. Kröeger et Al. - CNRS UPR15 (FR) H. Cachet et Al.

# Conclusion

- Various techniques are now available to protect windows :
  - Wipers
  - Copper shutter
  - Bleach
  - Local biocide generation
- The choice can be driven by different aspects :
  - Hardware matter :**
    - Robustness (depth of use)
    - Mechanical complexity
    - Easiness of adaptation to the existing instrument
    - Level of integration
  - Metrological aspect :**
    - Adverse effect to the measured parameter.
    - Is system can be turned on and off.
  - Economical aspect :**
    - Availability on the market.
    - Price.

# **Local Chlorination for biofouling protection of oceanographic sensors**

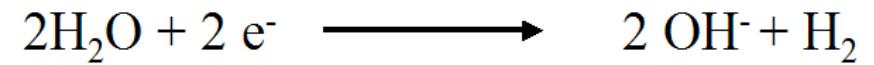

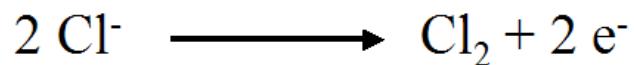

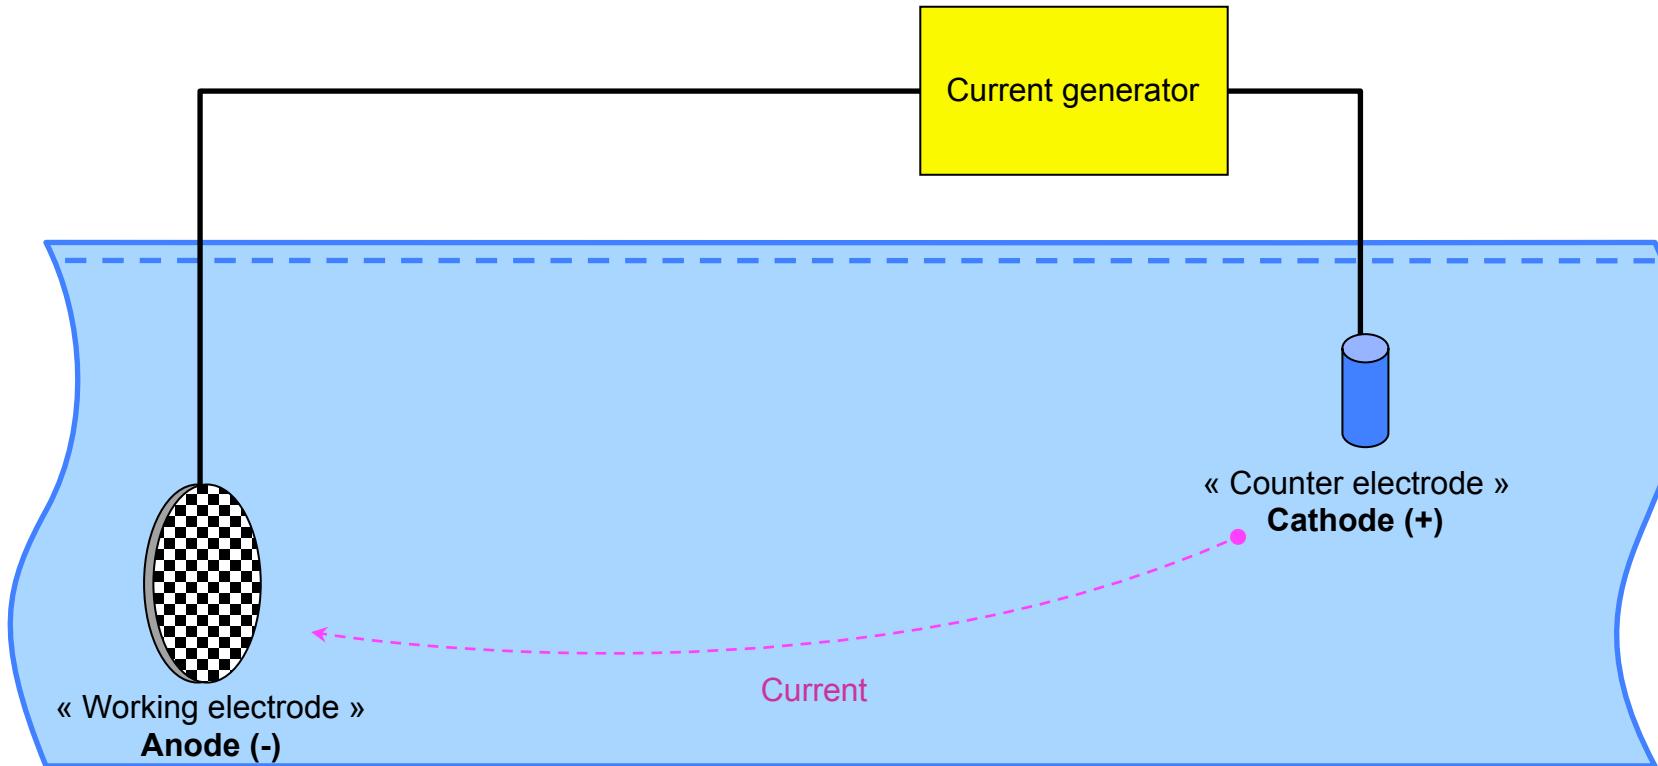

# **Chlorine Generation in Seawater**

## **Principle**

# Chlorine Generation System In Sea Water

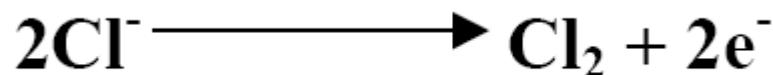

➤ Sea water electrolysis : Hypochlorous Acid generation.

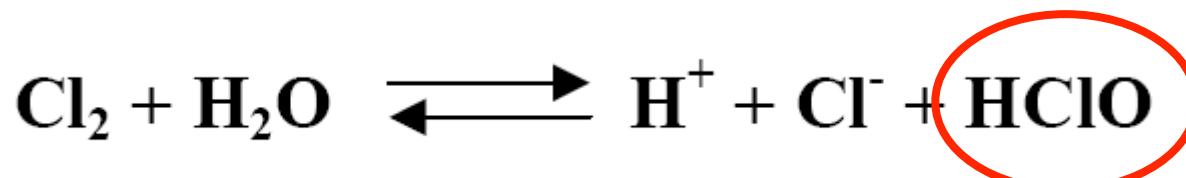

Note : Anode and Cathode naming is electrochemistry convention, electricity convention is the opposite.

# Chlorine Generation System In Sea Water

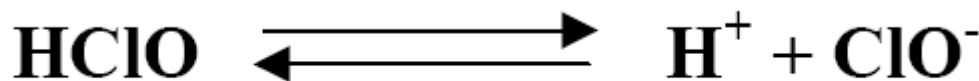

« Working electrode »  
**Anode**

Then in function of pH and Temperature :

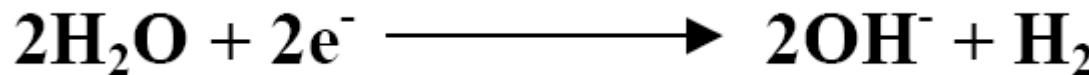

Hypochlorous Acid

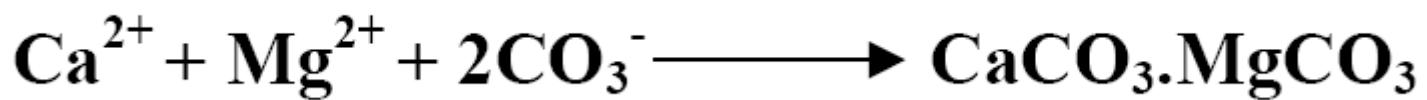

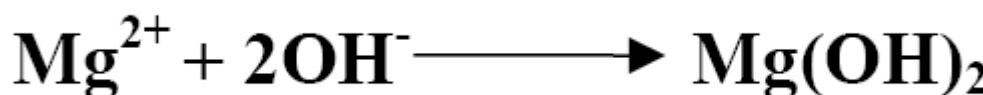

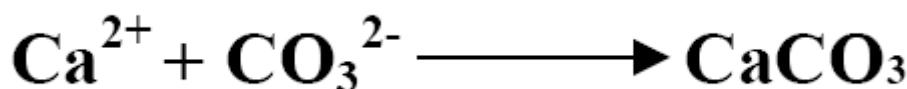

When pH => btw 7 and 8.5, temperature has no effect (Chambers *et al.*)  
Seawater pH = 8.2

# Chlorine Generation System In Sea Water

« Counter electrode »  
**Cathode**

A deposit can be observed on the counter electrode :

## Transmissometer Biofouling Protection System

Paul Macoun (VENUS Project Engineer)

Figure 4. INFREMER Biofouling system on VENUS

A customized bio-fouling protection system was installed on the Saanich Inlet SeaTech Transmissometer in February 2008. This local chlorination system was developed by engineers at the French research institute IFREMER.

The system is comprised of 3 electrodes, one adjacent to each optical window on the Transmissometer, and one centrally located between the two windows. The electrodes are supported by a small housing which contains the

system controller and several Lithium cells.

The principle used to reduce bio-fouling is the electrolysis of sea water, which produces free chlorine in the vicinity of the optical windows. The controller alternates voltage potential between the central electrode and each window electrode switching every 10 minutes.

Figure 4 shows the IFREMER system mounted on the SeaTech Transmissometer. Figure 5 is a graph of Transmissometer data from March 1—Aug 1 2007 (+ symbol) overlaid with data from the same interval the following year (lines). There is a noticeable difference from before and after the sys-

tem was mounted to the Transmissometer. The 2007 data indicate progressive fouling and resulting signal attenuation. The 2008 data look reasonable until mid-summer. The engineers at IFREMER believe the Lithium cells had become depleted at this point, and as a result we begin to see signal attenuation in June and July 2008.

In September 2008 the bio-fouling system was redeployed on the Transmissometer. The latest improvement to the system was the inclusion of a cable linkage to a Scientific Instrument

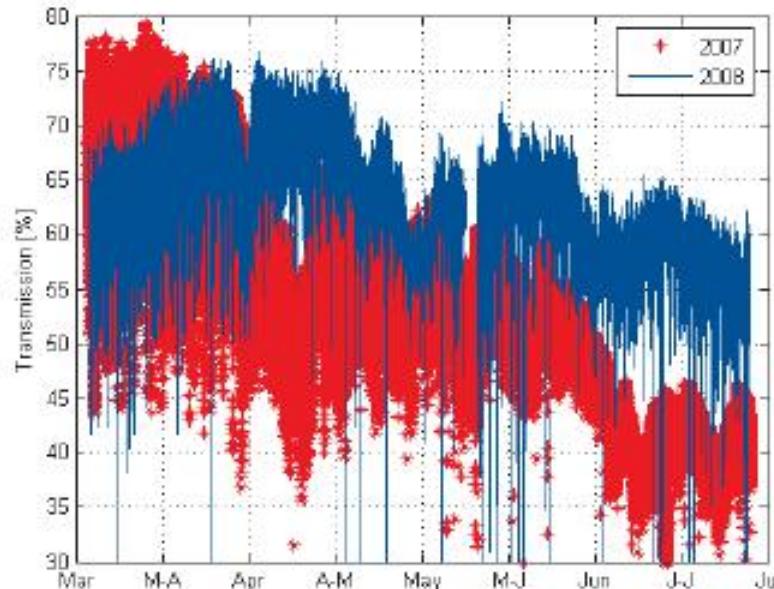

Figure 5. Transmissometer Data Comparison 2007-2008

Interface Module (SIIM). The system is now powered continuously through the VENUS array.

VENUS and IFREMER will continue to collaborate on bio-fouling protection systems. The present plan is to use the local chlorination system to protect other optical instruments on the various observatory platforms.

om

## Tempo mini Biofouling protection

A 6 months campaign has been performed with fouling protection OK.

# Conclusion

- Local Protection can be adapted to many kind of instrument quite easily.
- The energy need is compatible with autonomous monitoring (2 D cell for 3 months).
- Good results have been obtained for parameters commonly used for marine monitoring.
- local Protection can be scheduled in order to leave free time interval to perform the measurement (if needed).
- 50 mm diameter windows of optical sensors have been protected with success.
- In some situations, pumping should be kept in order to flush the system to prevent sediment trap or deposit on sensors.

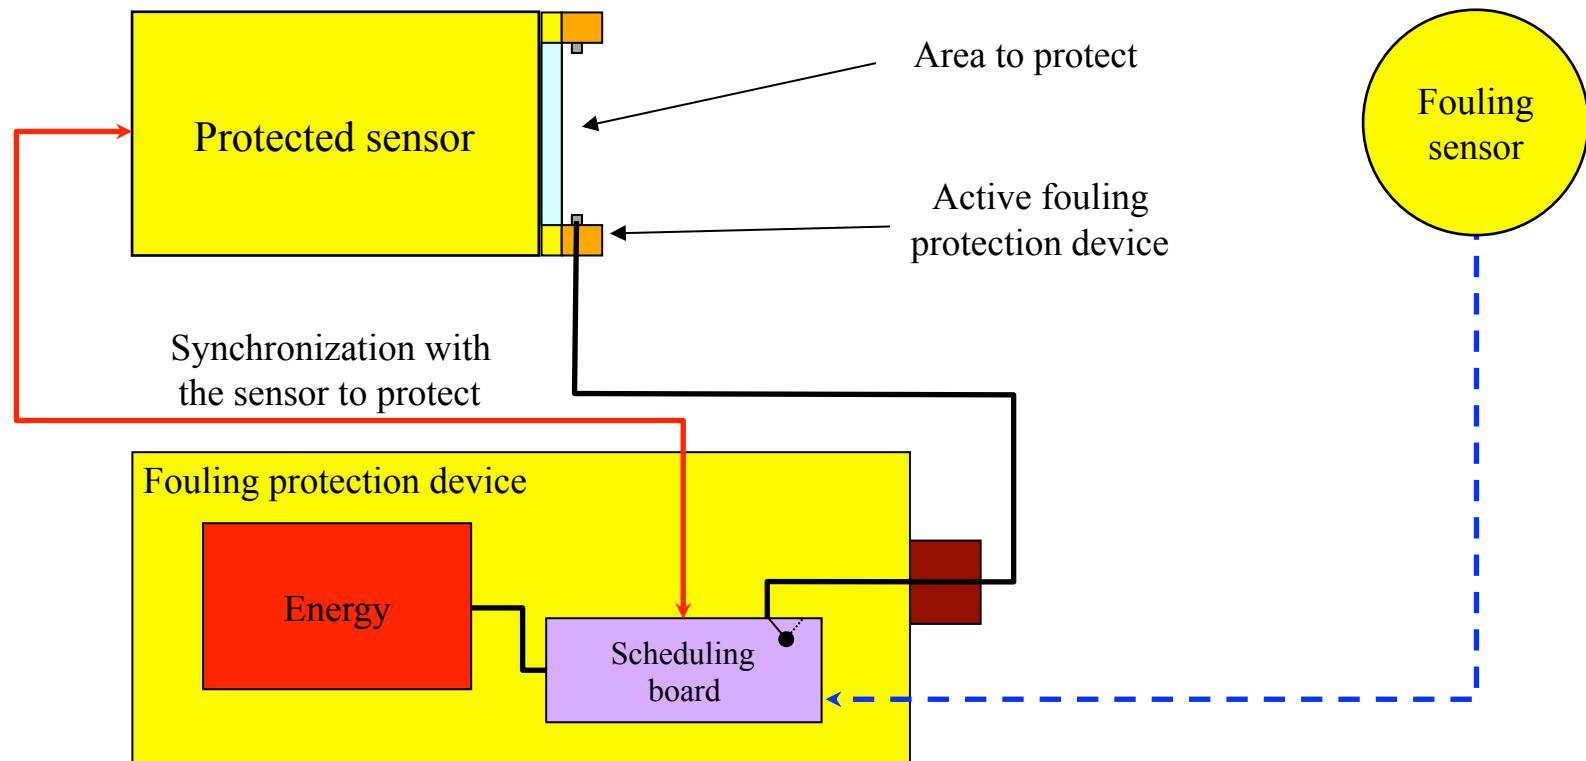

Ifremer Département Recherches et Développements Technologiques

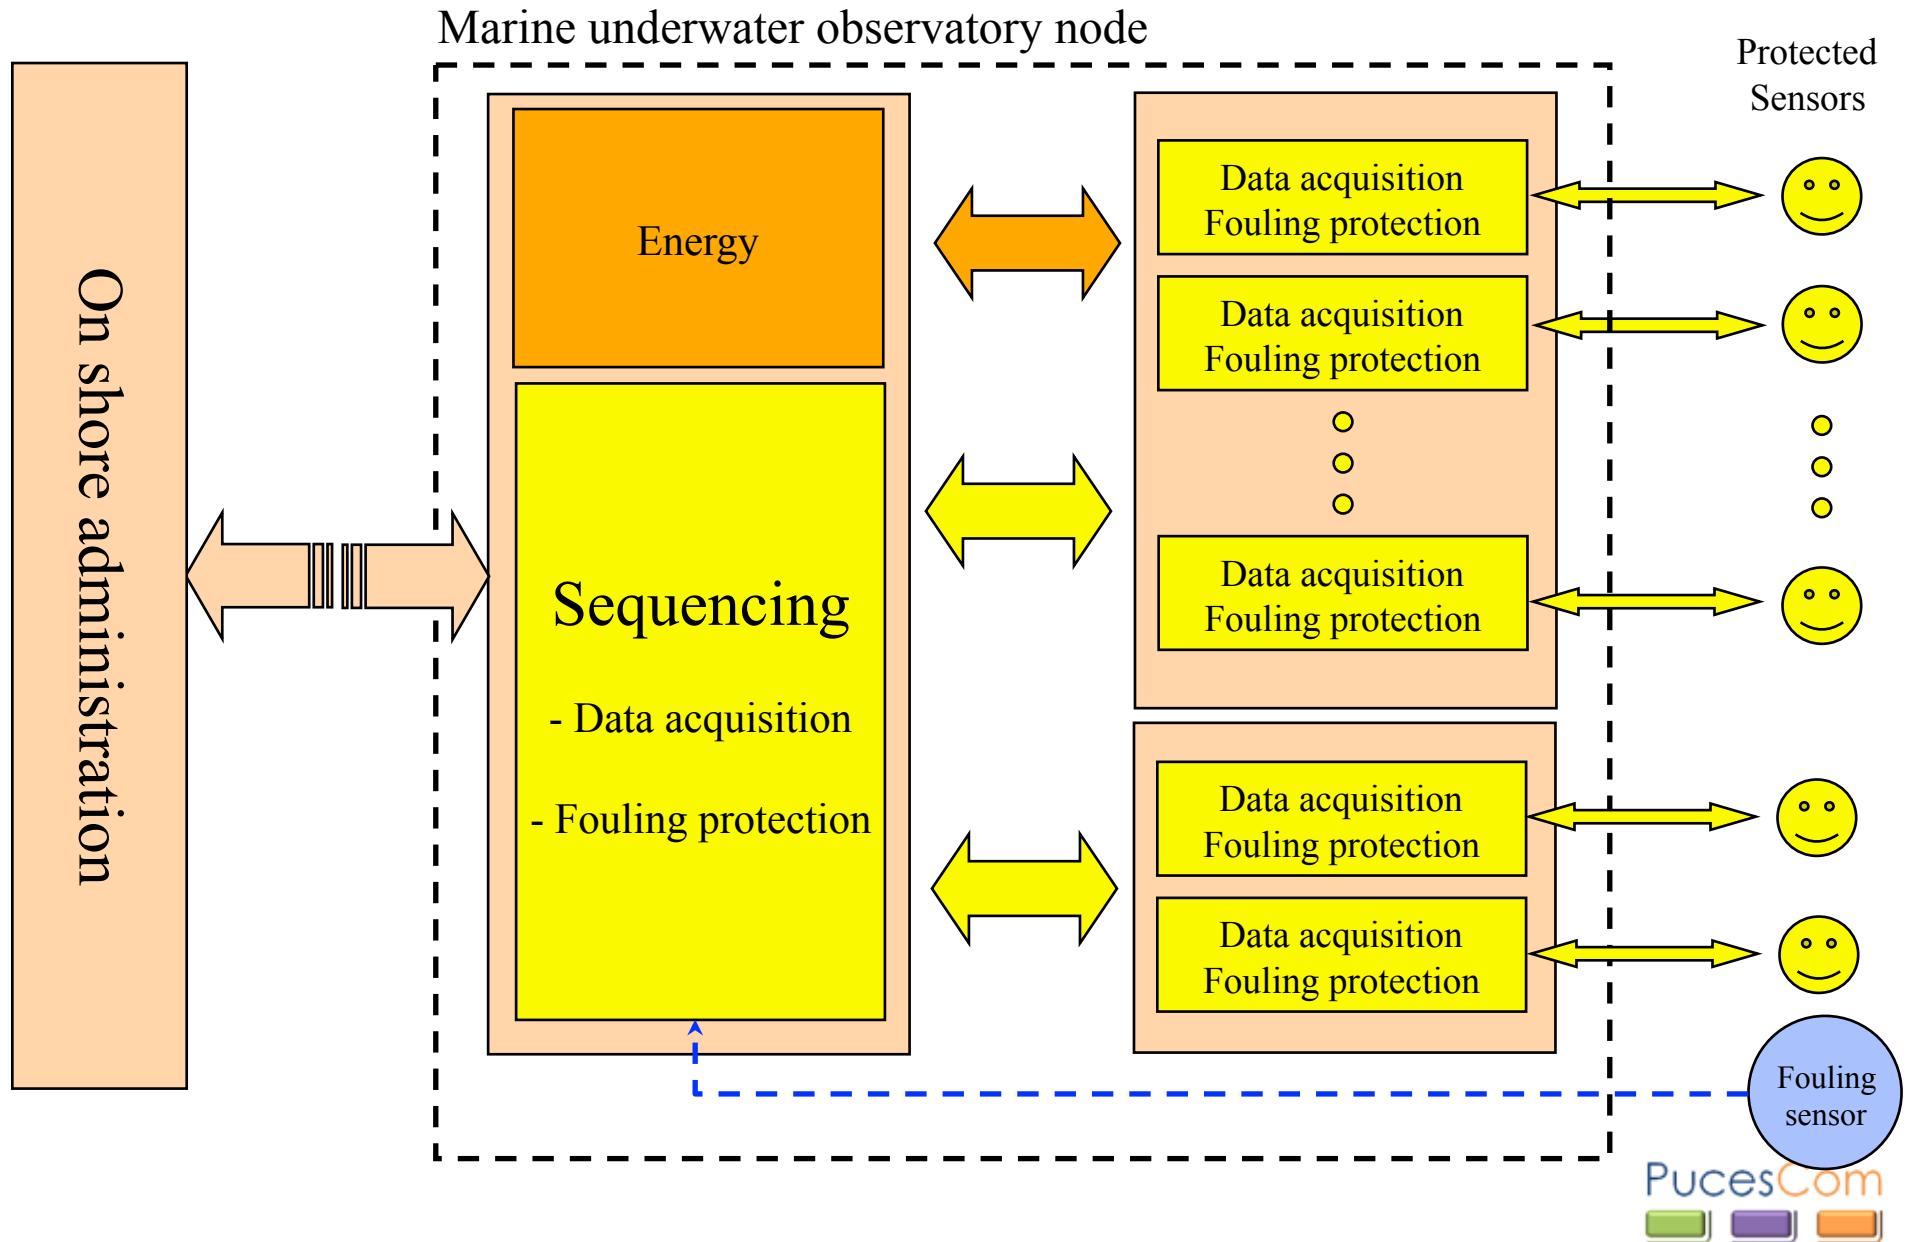

# Biofouling management

# Biofouling management

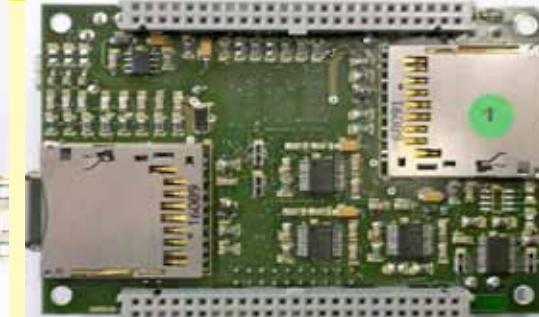

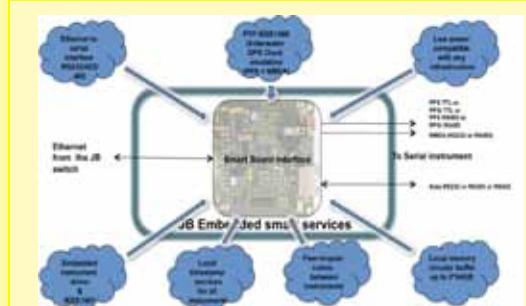

- Autonomous sequencing
- Internal powering (batteries)
- Fouling sensor for optimized scheduling
- Synchronization with the sensor to protect

# Global biofouling management

# Smart Sensors

- Composant clé dans l'architecture des observatoires pour assurer l'interopérabilité et la compatibilité des instruments sur différentes architectures câblées et non câblées.
- Cœur numérique de nouvelle génération:
  - Ajoute des services et des fonctionnalités réseaux aux instruments actuels
  - Permet la conception d'instruments/capteurs de nouvelle génération, communicants, basés sur Ethernet

- Crédit d'un consortium basé sur un développement collaboratif regroupant plusieurs instituts: Ifremer, Ensieta, IPGP/INSU, UPC Barcelone/SARTI (Espagne), KDM (Allemagne): Collaborations, publications...

# Conclusion

- Various techniques are now available to protect sensors :
  - Wipers
  - Copper shutter
  - Local biocide generation (Ifremer)
- The choice can be driven by different aspects :
  - Hardware matter :**
    - Robustness
    - Mechanical complexity
    - Easiness of adaptation to the existing instrument
    - Level of integration
  - Metrological aspect :**
    - Adverse effect to the measured parameter.
    - Is system can be turned on and off ?
  - Economical aspect :**
    - Availability on the market.
    - Price.
